RSS TEAM CONTRIBUTION

Provided on-site project management oversight for all efforts at the site from 11/2018 to present. RSS is responsible for providing project management, project coordinating, project scheduling, and the establishment (Leasing) of all on and off- site temporary facilities including submittals of all subcontractors within both facilities

Client's Requirements: (SOW)

Remove all dust/overspray accumulation from all surfaces within the work area utilizing wet wipe/scraping methods and HEPA vacuum methodologies. Decontamination of fixtures, walls, ceilings, floor, structural members and drain surfaces. Any water accumulation as part of the cleaning process must be treated (filtered to remove all contaminants), tested and approved by the Base prior to discharge. Contractor shall remove and dismantle all "paint booth" and "abrasive blast" ventilation and exhaust equipment and components (fans, filters, etc..) along with associated duct work located within the Building 7 former Corrosion Control Facility (CCF) with the exception of the current roof top units HV-21 and HV-22 and associated ductwork that supply heat to the area. All ductwork associated with HV-23 is to be decontaminated and removed from within the CCF. If unable to decontaminate ductwork onsite, all contaminated ductwork is to be characterized through representative lab sampling (TCLP), containerized and handled appropriately, potentially as hazardous waste. Supply Air Paint Booth System - Twin supply ductwork is to be removed. Material removed from the supply air system is anticipated to be non-hazardous and should be isolated from all exhaust materials removed. Material to be recycled by Contractor All recycling documentation and/or disposal records are to be supplied to the COR and the Base Environmental Manager.
